# Replacing a failed drive when using SW RAID

When a drive fails using software RAID, ONTAP Select uses a spare drive (if one is available) and starts the rebuild process automatically. This is similar to how ONTAP on FAS and AFF works. However, if no spare drive is available, you need to add one to the ONTAP Select node.

Both the removal of the failed drive and the addition of a new drive (marked as a spare) must be performed through ONTAP Deploy. Attaching a drive to the ONTAP Select VM using vSphere is not supported.

## Identify the failed drive

After a drive fails, use the Deploy utility CLI to identify the disk that failed.

### Steps

1. Sign in to the Deploy utility CLI using the administrator account.
2. Identify the disk that has failed.

```
<cluster name>::> storage disk show -container-type broken
Usable Disk Container Container
Disk Size Shelf Bay Type Type Name Owner
-----
NET-1.4 893.3GB - - SSD broken - sti-rx2540-346a'
```

## Remove the failed drive

After you identify the drive that failed, remove the disk.

### Steps

1. Sign in to the Deploy web user interface using the administrator account.
2. Click the **Clusters** tab and select the relevant cluster.

## Node Details

### > HA Pair 1

**Node 1** sti-rx2540-345a — 8.73 TB + ⚡

**Host 1** sti-rx2540-345 — (Small (4 CPU, 16 GB Memory))

**Node 2** sti-rx2540-346a — 8.73 TB + ⚡

**Host 2** sti-rx2540-346 — (Small (4 CPU, 16 GB Memory))

3. Click + to expand the storage view.

Edit Node Storage
